

Instructions

Frontend part:

This project is built on the reactjs framework, so first install reactjs app and node js in the system.

To install react app:

```
npx create-react-app client
```

In the client section, install all the dependencies listed in package.json file(submitted).

Then replace the src folder with the submitted src folder.

To run frontend go to client folder and use following command:

```
npm start
```

Backend part:

Create a database with name 'dbms' in mysql workbench with all the tables which are given in report with proper primary key and foreign key in all tables.

Now go to a server directory outside the client folder and create a json file:

```
npm init
```

Copy all files from submitted server folder and connect your mysql workbench with your credentials inside the index.js file.

Install all the dependencies listed in the package. Json file , submitted in server section.

To run backend, go to server folder and use following command:

```
npm run devStart
```
